

Concept of website

My midterm website will be a work in progress of my final. It will be my personal and professional website. It will showcase my works on photography, design and technology, while also showing my coding skills through the final product. The goal of my website is to attract clients and hopefully give art directors, designers and in general companies the right impression about the type of versatile artist that I am. It will be designed to be responsive, as I want it to be accessible in phone, tablet and computer. I also want to keep it simple, clean and color coordinated, which is my specialty as a photographer and designer.

Concepts I have learned

Knowing about divs, image placement and arrangement, css styling, background image, inline block, nav bar, background for nav bar, creating footers, link to Instagram, responsive dropdown menu/nav bar, media queries, classes, hover effects and Google fonts, transformations.

Concepts I need to learn

I want to learn how to make the home page have different sections and then kind of overlaying them so that I can show an image and then scroll down to a white background with a group of images and then back to another full screen image. I also feel like I still need to learn a little more of CSS styling but I will learn as I work on it. I also still need to learn how to make a click or link that send the user to another part of the same page.
